<b>Target version:</b> 7.5.0	
<b>Description</b> With the new form functions some validations that were done in views were moved to form validation. Beside better structured code now instead of losing form data and having a error message displayed on top, form data now persists and the error is shown at the specific field.  Following validations were moved: <ul style="list-style-type: none"><li>• Type validations</li><li>• Hierarchy validations</li></ul> Other improvements: <ul style="list-style-type: none"><li>• Event: added validation to check if selected super event isn't already a sub event</li><li>• Forms now aren't re-populated if there were form errors so that changes made are persistent when validation fails</li></ul>
